The Haywire Project

Table of contents

1. Mission Statement

The goal of the Haywire Project is to create the high level 1-Wire API that will allow to use the 1-Wire devices without requiring the API users to concern themselves with the low-level implementation and network layout details.

2. Brief History

The project definition requirements were crystallized during the development of the DIY Zoning project. It has become clear that though the existing 1-Wire API for Java allows controlling the 1-Wire network, it provides just one of possible abstractions, and the level of it may be a little bit too low for some applications.
